

Hytech silencers provide a significant decrease in noise level, both on the inside and the outside of decompression and hyperbaric chambers. The silencers do not obstruct air flow, they only reduce noise by eliminating turbulence. This is a huge advantage over sinter bronze filters, that can corrode, become obstructed, and eventually be blown to pieces by air pressure. Another advantage of our silencers is the possibility to direct airflow for good mixing of fresh air with the chamber atmosphere. The silencers can be used both inside the tank and outside in the exhaust lines. The silencers are available with a range of connections, from 3/8" to 2".

Multiple silencers for a hyperbaric chamber.

Hytech deflectors are meant to mount on the inside of the tank, in the exhaust lines. They will prevent objects from being blown into the exhaust piping. They are an important safety device in any pressure chamber.
