

UNDERWEAR is very important. The suit itself gives almost no Insulation, but is a protective enclosure which keeps the air inside and the water outside.

If a diver becomes cold in a dry variable volume suit, it is due to wrong or too little underwear.

Passive insulation makes use of the divers own production of heat.

With use of correct material passive insulation will as a rule be sufficient for normal air-diving.

Active insulation is necessary for mixed gas deep diving. Heat energy must be supplied to the diver by means of underwear with closed circuit hot water, by breathing gas heaters or electrically heated underwear.

Hytech carries a line of underwear suited for any sort of underwater work. They give the diver unequalled comfort and an excellent passive insulation.

At Hytech we are always striving to be able to supply the best and most complete list of commercial diving equipment available.

Not only are we constantly improving and adding to our own products, we also continue to add to our list of manufactures.

If you need a product that is not in this catalog, give us a call, we may just have what you need.
